BEST AVAILABLE IMAGES

Defective images within this document are accurate representations of the original documents submitted by the applicant.

Defects in the images may include (but are not limited to):

- BLACK BORDERS
- TEXT CUT OFF AT TOP, BOTTOM OR SIDES
- FADED TEXT
- ILLEGIBLE TEXT
- SKEWED/SLANTED IMAGES
- COLORED PHOTOS
- BLACK OR VERY BLACK AND WHITE DARK PHOTOS
- GRAY SCALE DOCUMENTS

IMAGES ARE BEST AVAILABLE COPY.

As rescanning documents will not correct images, please do not report the images to the Image Problem Mailbox.

```
    void bits_shuffle_map_init(ScatterDescr *shuffle_map);
    void bits_shuffle(Module md, ReferenceTable *ref_table.
    CompressedBitstring *comp_bitstring)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  right). i' = i/8 + (7 - i \%). Now i has to goto "i) (say) according to the documnet. But, m(i) is actua.1y located at m(i)' = m(i)/8 + (7 - m(i)\%8). In this descriptor, we need to provide a mapping from i' to m(i)'.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             1. Find, out for each m(i)' (of the final text segment block)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ith bit from the left. But this ith bit will actually reside at a different position i' because the bits are reversed within a byte (within a byte, the lsb is to the
                                      thru 255, we are trying to find the position of the

)

```
Reads the scatter table from the memory image of md into s_table. Space for s_table is allocated here. The only precondition is that the module structure md must have been initialized to have the values of md -> global_image, md -> scatter_tbl_offs and the memory image of the global partition must be available.
                                                      Copy the values of all the fields from item_src to item_dst.
It is assumed that item_dst has sufficient space to hold

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Copies the scatter_table entries from src to dst. It is ssumed that dst is currently initialized but has no entries in it. This routine is required in the compressor for copying the scatter table from the input module to the output module.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             By copying the scatter table from input to output right at the beginning, the scatter types of all the bitfields that are not

```

scat_id = scatter_table_lookup(input_s_table, &c scatter_descr_cpy(scat_ptr, &collapsed_d LOG_ERROR('Illegal value returne new_offset = (src_pos - (src_pos % 8)) + &collapsed_de scat_ptr = get_free_scatter_descr(input_ scat_id = scatter_table_lookup(input_s_t new_o new_descr.total_width = reverse_descr.total_widt lelse if (local_descr.table(j].src_offse new_descr.num_entries = reverse_descr total_widt else if (local_descr.table(j).src_offse for (pos=0; pos < reverse_descr.total_width; pos extension_start[slot]+8; local_descr.table[j].src_offset if ((src_pos = get_position_in_src(pos, local_descr.table(j).src_offset new_descr.table[pos].dst_offset = pos; new_descr.table[pos].width = 1; extension_start(slot); instruction) except that the bits get reversed, which needs to be taken into account. Once that is done, we can enter this in the scatter table. "/ two_bit_start[slot]; twenty, four_bit, start[slot]; reverse_scatter_descr(&local_descr, &reverse_descr); (7 - (src_pos % 8)); new_descr.table[pos].src_offset = in place(i.e., refers to the position in the final /* Now everything for the address field format is op_ptr -> address_field_format = scat_id; * *** ****

```
in the way the instruction gets written into the compressed file.
                                                  This involves combining the format bits and the operation bits, and moving bits around in the instruction based on the 24-bit
                                                                                                                                            part, 2-bit part and the extension part information.
This also means that the scatter types of the addresses need
recomputing and appropriate entries made in the output scatter
                                                                                                                                                                                                                                                                                                         table. (which is unfortunately called input_s_table here!)
```

NOTE: Here the context_bits are from the next instruction. If context_bits is NULL CONST_FORMAT is used.

:

```
if (op_ptr -> address_field_format == NO_ADDRESS) {
    sprintf(error_str, Address field format not avai
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     -> address_field_format = get_address_format(op_ptr ->

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      returns the scatter_id of the address field format. The scatter id is w.r.t the scatter table which was passed to the functions get_compressed_ops and dressup_ins. It is the scatter table of the output module.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       correct final instruction.
